Partnership Proposal & Needs Assessment

COP 3710: Database Concepts

Spring 2026

Submitted by Team 7:

Adil Zaben	azaben8742@eagle.fgcu.edu
Sean Peppers	speppers5329@eagle.fgcu.edu
Katharine Ringo	karingo2009@eagle.fgcu.edu

Submission Packet Contents:

1. Partner Confirmation Form
2. Needs Assessment Meeting Notes
3. Eagle Service Network (ESN) Registration
4. Project Proposal

Submission Date: February 25, 2026

PART A: PARTNERSHIP IDENTIFICATION

1. Partner Confirmation Form

PARTNER CONFIRMATION FORM

COP 3710 - Database Project with Service Learning (Spring 2026)

STUDENT TEAM INFORMATION

- **Team Number:** 7
- **Team Members:** Adil Zaben, Sean Peppers, Katharine Ringo

COMMUNITY PARTNER INFORMATION

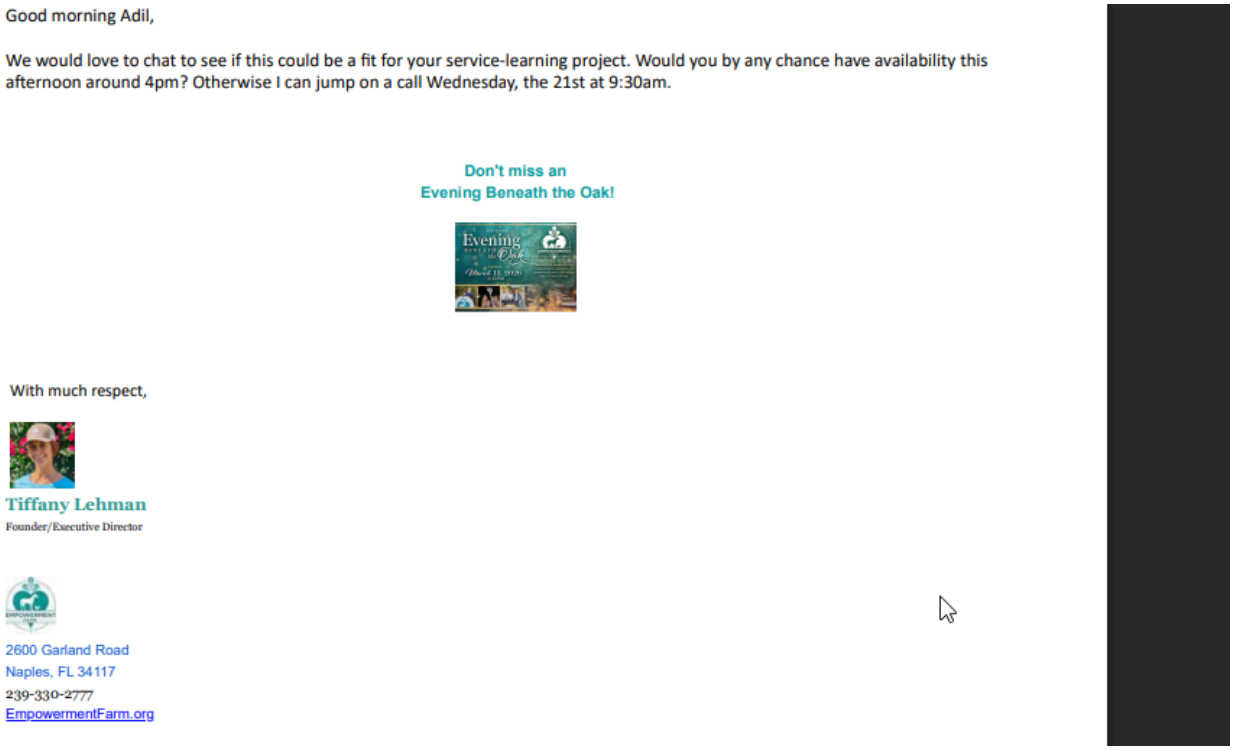
- **Organization:** Empowerment Farm **Contact:** Tiffany Lehman
- **Title:** Founder/Executive Director **Email:** Tiffany@empowermentfarm.org
- **Phone:** 239-330-2777

Brief Description of Organization Mission:
Empowerment Farm is a non-profit dedicated to supporting their community through compassion and connection to the land and animals. They help provide our local area with inclusive, hands-on learning via applied education and work-based skills. Our team will develop a relational database to track program activities and measure participation outcomes to support grant reporting.

CONFIRMATION

By signing below, we confirm our partnership for the COP 3710 Database Project (Spring 2026). The student team will design and develop a database system to address the organization's data management needs.

Student Team Lead: Adil Zaben **Date:** Jan 28, 2026
Partner Signature: Tiffany Lehman **Date:** Jan 28, 2026



Good morning Adil,

We would love to chat to see if this could be a fit for your service-learning project. Would you by any chance have availability this afternoon around 4pm? Otherwise I can jump on a call Wednesday, the 21st at 9:30am.

Don't miss an
Evening Beneath the Oak!

With much respect,

Tiffany Lehman
Founder/Executive Director

2600 Garland Road
Naples, FL 34117

2. Needs Assessment Meeting Notes

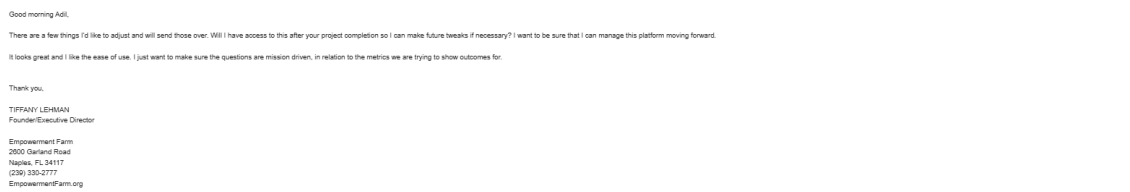
Date:	January 28, 2026
Attendees:	Adil Zaben (Team Lead), Tiffany Lehman (Executive Director)
Subject:	Initial Needs Assessment & Project Scope Refinement

Current Data Challenges

- **Disconnected Spreadsheets:** Current tracking is done via separate spreadsheets, making it impossible to see if the same person is attending multiple different programs; she uses a Jotform.
- **Measuring Outcomes:** The partner struggles to quantify subjective feelings (like feeling "grounded" or "connected") in a way that can be reported to grant providers.
- **Privacy vs. Tracking:** We need to track visitor retention (who comes back) without creating mandatory user accounts or storing sensitive personal data for minors.

Identified Data Needs

- **Core Entities (What we need to track):**
  Open Farm on Second Saturday, Yoga on the Farm, Tuesday Night Tuck-In. Group Programs).
  - *Participants:* Anonymous visitors differentiated by Age Group and Zip Code.
  - *Visits/Feedback:* The actual record of a person attending a specific program.
- **Retention Analysis:**
- The database needs a **One-to-Many** relationship between Participants and Visits to calculate Return Intent (what percentage of people say they will come back).
- **Donor Interest Pipeline:**
- We need a conditional logic flow to flag adult participants who express interest in donating. This will be a simple Boolean flag in the database that can generate a report for the director.
- **Custom Question Generation:**
- We need a logic addition to allow the NGO to add custom questions for the future when we hand off the project. One question can have many answers, and the response form can contain many answers.



Good morning Adil,

There are a few things I'd like to adjust and will send those over. Will I have access to this after your project completion so I can make future tweaks if necessary? I want to be sure that I can manage this platform moving forward.

It looks great and I like the ease of use. I just want to make sure the questions are mission driven, in relation to the metrics we are trying to show outcomes for.

Thank you,

TIFFANY LEHMAN
Founder/Executive Director

PART B: PROJECT PROPOSAL

1. Project Objective

The primary objective is to design and build a secure **Relational Database** for Empowerment Farm. This system will replace their current manual spreadsheets with a centralized database. The new system will organize program participation data, allowing the organization to run reports on visitor retention, program popularity, and demographic trends to help secure future grant funding.

2. Community Partner Overview

Empowerment Farm (Naples, FL) provides inclusive, nature-based therapeutic programs.

- **Mission:** Connecting the community to land and animals to foster compassion and confidence.
- **Data Context:** The organization currently relies on anecdotal evidence ("stories") rather than hard numbers. They lack the data structure to prove their impact to stakeholders quantitatively.

3. Scope of the Project

In Scope (Database Core):

- **Schema Design:** Creating normalized tables to handle Programs, Participants, and Feedback.
- **Data Integrity:** Using Foreign Keys to ensure every piece of feedback is linked to a specific Program Date.
- **Views & Reports:** Creating SQL Views to automatically calculate "Retention Rates" for the dashboard.
- **Digital Survey Form:** A front-end form to act as the data entry point, ensuring clean data goes into the system.

Out of Scope:

- **Payment Processing:** We will not handle credit cards or financial transactions directly in this database.
- **Medical Records:** No HIPAA-regulated medical data will be stored.

4. Dataset Description

The database will utilize the following data types:

- **Demographics:** Age Ranges (ENUM) for sorting visitors.
- **Timestamps:** To track engagement trends over quarters/years.
- **Qualitative Scores:** Converting subjective user feedback. like "I feel better" into number scales (1-5) so averages can be calculated.
- **Flags:** Boolean (Yes/No) fields for 'Return_Intent' and 'Donor_Interest'.

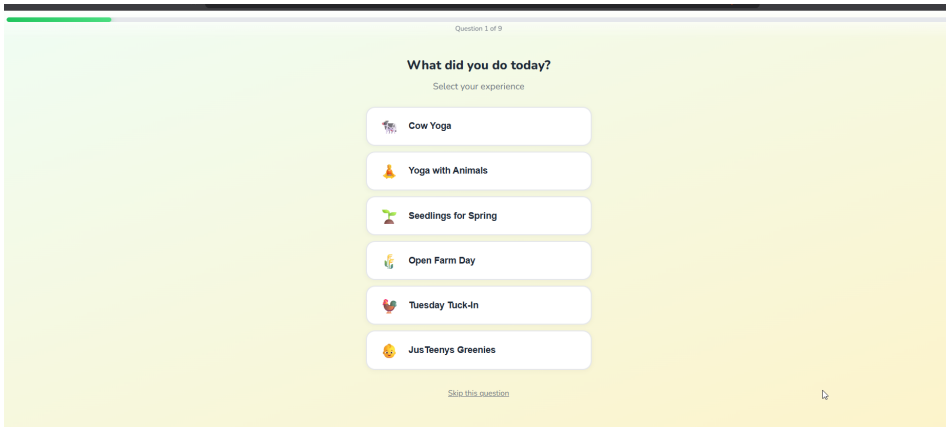

Figure 6: Concept: Data Entry Interface

5. Impact Statement

This database will help move decision making from anecdotal evidence to **data supported decision making**.

- **Better Grant Reporting:** The ability to run queries like *"Show me retention rates for the Yoga program vs. Open Farm for participants under 18."*
- **Efficiency:** Eliminates the need to manually review responses in Jotform; more time doing real work!

6. Partner Approval

Refer to Figure 7 for formal confirmation of the project!

DATABASE IMPLEMENTATION

1. Table Creation (DDL)

Our DDL SQL file establishes the structure foundation for the Empowerment Farm Database. As it currently stands, we have 11 distinct tables that track programs, participants, survey responses, and donor interests, as it is what is in the project scope as of now.

- **Core Entities:** `programs`, `participants`, `surveyresponses`
- **Lookup Tables:** `age_ranges`, `referral_sources`, `donation_options`
- **Analytical Tables:** `mission_scores`, `mood_tracking`, `feedback`

- **Customization:** `custom_questions`, `custom_answers`

Here, we ensured the proper primary and foreign keys were implemented. We also ensured constraints, like a survey score must be bound between 1 and 3, were implemented to ensure accurate results. It should be noted we are still refining requirements. One recent refinement was on the customization aspect, as she wants to be able to add custom questions, as questions and events often change.

2. Data Population

As the assignment requires, we demonstrate the database's functionality; the tables have been populated using the data population file.

- **Survey Responses:** Then, we simulated participant data and corresponding survey responses, like their mood at the farm, were generated; this mirrors the data the survey will collect. This populated dataset enables immediate testing of SQL queries required for generating retention rate reports and donor pipelines. Thus, the database is now initialized to start testing SQL queries, generating retention reports, and seeing how we can further refine our requirements and ensure a working system.
